

Materials:

- CAM meter (8 steps) + marker
- ECM (8 steps, can increase by 2 during gameplay) + marker
- Money tokens (50)
- EU pool marker
- Energy tokens (50)
- Cards
 - Farmer Object Cards (10 total)
 - 1 Construction Worker Friend
 - 3 Solar Panels
 - 3 Mini Wind Turbines
 - 1 Local News Station
 - 1 Community Battery Bank
 - 1 Community Organization
 - Farmer Effect Cards (10 total)
 - 1 Lawyer Cousin
 - 1 Bureaucracy Expert
 - 1 Save the Birds
 - 1 Tax Return
 - 1 Community Effort
 - 1 Sell it to the Danes
 - 1 Ugly Windparks
 - 2 Loppis
 - 1 Festival
 - Government Object Cards (12 total)
 - 3 Windparks
 - 3 Solar Parks
 - 1 Bird Sanctuary
 - 1 Limestone Factory
 - 1 City Visby
 - 1 Energy Storage Research
 - 1 Harbor
 - 1 Tourism Center
 - Government Effect Cards (7 total)
 - 1 Blinding Lights
 - 1 Questionable Expertise
 - 1 Computer says "no"
 - 1 World Catastrophe
 - 1 Tax Filing
 - 1 We Need It More
 - 1 Re-checking Forms
 - Weather Cards (8 total)
 - 1 Extreme Storm
 - 1 Clear Skies
 - 2 Cloudy Month
 - 2 Summer/Heat Wave
 - 2 Winter/Blizzard

the cards:

Farmer Object Cards	Farmer Effect cards	Gvmt Object Cards	Gvmt Effect Card
Construction worker friend: lowers the amount of stacked money needed by 1 for each upside down Solar Panel and mini wind turbine once per round	Lawyer cousin: for free instantly activate 1 Object card for no cost	Windpark: needs 6 money to flip Generate 5 energy per round generate 4 money per round lower the City Attraction meter by 1(only once)	Blinding lights: take one Solar panel card down. It blinds the overhead military planes
Solar Panel: needs 3 money to flip generate 2 Energy per round	Bureaucracy Expert: pay 5 money activate two Farmer object cards and take ownership, if you do not already own them	Bird sanctuary: needs 5 money to flip nullify all “Save the Birds” effect cards pay 3 money per round; if the money is not paid, the card is discarded raise the Community Attraction meter by 1 (only once)	Questionable expertise remove every “ Construction worker friend ” card from the field the work quality is not according to government standards
Mini Wind turbine needs 2 money to flip generate 1 Energy per round	Save the Birds take one Wind park down	Lime stone factory needs 4 money to flip Consumes 1 energy per round generates 1 money per round lower the Community Attraction meter by 1 (only once)	Computer says “no” increase the amount of stacked money needed by 2 for one upside down Object card on the field
Local News Station needs 2 money to flip when a object card was taken down by the government pay 2 money and put it back on the field the next round with no stacked money on it	Extreme storm: no wind energy gets generated this round the winds were to strong and all wind turbines had to be shut down	City Visby needs 5 money to flip Consumes 5 energy per round	World catastrophe: take down one “ Local news Station ” card by distracting the population with a unrelated world event

Community Battery Bank: needs 3 money to flip increases the energy overload meter capacity by 1 (only once, effect is permanent)	Cloudy months: no solar energy gets generated this round	Solar Park: needs 4 money to flip Generate 3 energy per round generate 1 money per round lower the City Attraction meter by 1(only once)	Extreme storm: no wind energy gets generated this round the winds were to strong and all wind turbines had to be shut down
Community Organization: needs 4 money to flip any activated object cards on the Farmer's side of the table that generates at least 1 energy now generate 1 additional energy per round	Heat Wave: minus 1 solar energy per source minus 1 wind energy per source people use less energy in Summer	Energy Storage Research: needs 4 money to flip increase the energy overload meter capacity by 1 (only once, effect is permanent)	Cloudy months: no solar energy gets generated this round
	Blizzard: minus 1 solar energy per source plus 1 wind energy per source	Harbor needs 4 money consumes 3 energy per round generates 2 money per round	Heat Wave: minus 1 solar energy per source minus 1 wind energy per source people use less energy in Summer
	Tax Return: Government player must give you one money; if they do not have money, raise your CAM by one	Tourism Center needs 2 money consumes 2 energy generates 2 money	Blizzard: lower the Energy-net overload bar by 1 more electricity is used in Winter
	Community Effort: +1 energy point on the round it is played instantly activates one object card for no cost		Tax Filing: Each Farmer must give you one money token. If they do not have a money token, they must lower the CAM by one.

	Sell it to the Danes Force the government to sell their Solar park to the danes (one solar park card gets removed)		We need it more Take one Mini wind turbine or Solar panel from the farmers, put it on your field, it now generates energy for you
	Ugly windparks You protest against the windpark ruining your scenery and demand compensation get one money token from the government per active windpark		Re-checking forms deactivate a farmers mini wind turbine or solar panel this round, you found an error in their paperwork
	Loppis +2 money		
	Festival +2 CAM		

In what order to read the rules:

1. **How to play**
2. **Energy-Consumption-meter(ECM) and Community-Attractiveness-meter(CAM) ?**
3. **How to play the cards**
4. **What cards?**
5. then every player places their 2 cards on the field, after that read
6. **“Accounting phase”**

How to play

1. government and farmers sit in front of each other
2. shuffle the farmers effect- and object cards together
put them on a pile upside down and
3. pull 5 cards(don't show them to each other)
4. the government does the same with their object- and effect cards and also pulls 5 cards
5. the farmers want to increase their city attraction meter by earning enough money
6. the government wants their building-cards to have enough energy and their energy meter not overloaded
7. After 20 rounds (completing the Accounting phase), if nobody has won, the game ends. The person with the most active object cards on the field wins.
 - a. If there is more than 1 farmer, they count their object cards separately

Energy-Consumption-meter(ECM) and Community-Attractiveness-meter(CAM) ?

1. The farmers win by reaching the highest level of their **Community-Attractiveness-meter(CAM)** first
 - a. the CAM starts at 1
 - b. farmers pay 2 money points to the government to raise their CAM for each step (hence pay 4 money to raise the meter by 2 steps)
 - c. some government cards influence your CAM negatively immediately, no matter what phase you are in
2. The government wins if they have all their building cards (City Visby, Limestone Factory, Harbor, Tourism Center) activated on the play field and sustained with enough energy
 - a. if their ECM reaches the highest point a power outage will occur and all building cards will be inactive next round, additionally the government pays each farmer 1 money
 - b. after that reset the ECM to the lowest point

How to play the cards

1. the oldest player starts, then continue clockwise
2. 2 cards can be played per player turn
 - a. if the player has no card they can play, they can discard 1 card and pull a new one or skip their turn
 - b. if the player has a weather effect card IT HAS TO BE PLAYED
 - c. pull new cards after your turn until you have 5 cards again
3. both farmers start with 4 money each
4. the government starts with 4 money and 4 EU fund money
 - a. EU funds can only be used to buy wind parks or solar parks
5. The government starts with the "City Visby" building card already flipped sideways on their field

What cards?

1. when a object cards is played it requires money to be activated
 - a. either pay the money immediately and turn the card upright to activate it
 - b. or stack money per round on the card, until you can activate it
 - c. if you have an effect card that can flip it immediately, then use the effect card and activate your object card
2. when playing an effect card it will be discarded after using its effect, hence immediately after putting it on the play field
3. Weather effect cards influence the object cards on the field
 - a. they must be played if the player has no other cards that can be activated instead
 - b. Weather cards get thrown away after all players have counted their points and completed their turn
 - c. only one weather card may be active at a time
 - d. If you have 2 players, shuffle 3 weather cards into the farmer's deck and 3 weather cards into the government's deck. If you have 3 players, shuffle the remaining 2 weather cards into the farmer's deck.
4. The government has building-cards which consume energy per round
 - a. they prevent the **Energy-Consumption-meter(ECM) from overloading**
 - b. if a building-card has not enough energy to be sustained during this "Accounting-phase" it gets flipped sideways(deactivated) next round
 - c. if the government themselves does not generate enough energy during the accounting phase, they can reduce the **ECM** by the needed amount of energy points and keep the building activated
5. If no more cards can be pulled, reshuffle the discard pile and turn it upside down, start pulling from that pile now

"Accounting phase"

1. after all players have placed their 2 cards on the field
 - a. each player calculates how much energy they generate based on the activated object cards
 - b. the activated object cards generate energy until they are removed from the play field

- i. IMPORTANT: energy points do not stack, if you have one mini turbine (1energy) and one solar panel (2energy) you generate 3 energy points this accounting round.
Next round if you still have the same cards on the field you still have 3 energy in total, not 6
- c. farmers receive 1 money coin, per 2 energy points generated
- d. the government counts all energy points generated by all players
- e. the government puts their generated energy points on top of the activated building-cards according to how many they consume
for example: the government produces 5 energy points this round, City Visby Consumes 5 energy per round, hence put your 5 energy points on this card
- f. The government's EU-funds pool refills every accounting phase by 1 money; it cannot go above 8
- g. the government raises their ECM by 1 step for each 2 unconsumed energy points currently in the game, rounding down
for example:
farmer one generates 2 energy, farmer two generates 5 energy, government consumes 3 energy, raise the ECM by 2 steps ($2+5-3=4$)
